Over-Site Intelligent Printing

Composition Research Technologies, Inc. (CRT) provides an intelligent printing solution that will never jeopardize your ability to offer the exact solution desired to get any print job to any printer any where. Our solution can provide print transformation, bursting, indexing, pre and post processing. Distribution of the resultant print files may then be accomplished to a virtually unlimited number of printers. That's not all. If desired, additional distribution can be done via email, File Transfer Protocol (FTP), while providing tracking information, automatic file purging, Web-Enable files for database usage and much, much more.

Documents such as invoices, statements, accounting reports, merchandise catalogs, telephone directories, legal publications, user's manuals—just to name a few can all be done without user intervention. Output formats include: Adobe Portable Document Format (PDF), PostScript, IBM AFP, Xerox Metacode, XML or HTML.

Customized System For All Installations

Over-Site can be customized to fit each customer's specific needs. This is done through a user-friendly program called The Over-Site System Generator, and can be accomplished by the customer *without* vendor support.

Most things can be selected with System Generator, but whenever the unique requirements of any customer cannot be satisfied with System Generator, the Over-Site system supports user custom processes (PROC) that will then be executed by Over-Site. An optional SDK is available to create PROCs or CRT can create them for you. Some examples of these functions are: file splitting, file parsing and external index creation, file sorting, folder creation, file manipulation, etc.

Many Available Choices For Distribution

There are many possibilities that may arise with respect to document distribution. Over-Site can handle a very wide array of possibilities for you.

- Drive any number of LAN Printers
- Push to Servers
- Create & Deliver E-Mail
- Create & Deliver Faxes
- Create Local Repository
- Automatic Scheduling of File Purging

COM Interface

Use the built-in COM interface to further customize your installation via Visual Basic, Visual C++, or any other language that supports COM.

Automatic Operation

By creating and designating any desired number of folders as 'hot' or 'watched' folders, Over-Site Intelligent Printing will monitor these folders at a user-defined interval. Should any data files be found in these folders, they will be moved for processing and distribution as per pre-determined specifications.

The number of folders that may be designated in this fashion is virtually limitless. Should additional folders and distribution be necessary, adding them is a few clicks away.

Solution For All Your Document Needs

Over-Site can process documents of numerous types directly into any available format and automatically fulfill your distribution requirements.

Documents of the following type may be processed via Over-Site as inputs:

- Mainframe Line Reports
- Microsoft Word or Excel Documents
- Adobe PostScript Files
- Any Automated Composition Task**
- Any print stream—AFP, PCL, Metacode, DJDE

** - Over-Site is tightly integrated with Datalogics' powerful automated composition engine, Pager. By including this engine with your Over-Site system, any manner of automated composition may be done. Some examples are: green bar reports, technical manuals, accounting reports, user's manuals, directories and law and legal publications.

Any and *all* of these tasks may be accomplished as an automated (Windows Service) or in 'point & click' mode, as with any Windows application. After Over-Site is installed on your system, it becomes an integral part of your Windows Explorer. Processing files with the 'point & click' mode is as easy as launching Windows Explorer, pointing at the file to be processed, and the rest is automatic.
